QUALITY VALVE MANUFACTURER

QUALITY COMMITMENT

Quality is Our First Priority.

Consistent product quality and a proven track record makes Australian Pipeline Valve a dependable choice for cast Gate, Globe and Check Valves, where total reliability is the number one concern.

Since its founding, APV's philosophy has been focused on quality. Our valves are manufactured in full compliance to worldwide standards (such as ASME/ANSI, API, EN, ISO, BS, AS).

MATERIAL COMBINATIONS / FEATURES

CAST STEEL GATE VALVES ANSI CLASS 150 ~ 2500

FEATURES

- Bolted bonnet, OS&Y, Flexible wedge.
- On smaller size valves, the yoke is cast integral with bonnet. Larger size valves have two piece yoke, refer to individual drawing.
- Stem nut is mounted with ball bearings to reduce operating torque for ease of manual operation in larger sizes and higher classes.
- Self aligning two piece gland.

APPLICABLE STANDARDS

- Valves designed to API Std. 600 and BS 1414
- Valves tested to API Std. 598
- Face-to-face to ANSI B16.10
- Flanged ends to ANSI B16.5
- Butt-welding ends to ANSI B16.25
- Trim and seating surface as per API 600 standard.
- Stuffing box smoothness $\leq Ra\ 3.2\ \mu m$ (superior to API 600)
- Stem smoothness to API 600 $\leq Ra\ 0.80\ \mu m$

API 622 & ISO 15848-1
Fugitive Emission Certified

API 607 & ISO 10497
Firesafe Certified

MATERIAL COMBINATIONS / FEATURES

Body Guided Disc style eliminates side thrust and provides longer disc, seat and body life as well as ensuring positive shut-off and low closing torque.

CAST STEEL GLOBE VALVES ANSI CLASS 150 ~ 2500

FEATURES

- Bolted bonnet, OS&Y, Swivel Disc.
- Plug type disc (Ball type also available).
- On smaller sizes, the yoke is cast integral with bonnet. Larger sizes have two piece yoke, refer to individual drawing.
- Stem nut is mounted with ball bearings to reduce operating torque for ease of manual operation in larger sizes and higher classes.

APPLICABLE STANDARDS

- Valves designed to ASME B16.34 / API 623 wall thickness to API 623
- Valves tested to API Std. 598
- Face-to-face to ANSI B16.10
- Flanged ends to ANSI B16.5
- Butt-welding ends to ANSI B16.25
- Trim and seating surface as per API 600
- Stuffing box smoothness $\leq Ra\ 3.2\ \mu m$ (superior to API 623 / API 600)
- Stem smoothness to API 623 $\leq Ra\ 0.80\ \mu m$

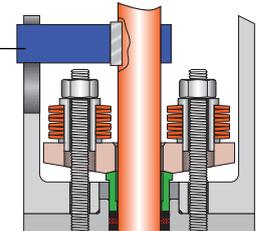

API 622-2 & ISO 15848-1
Fugitive Emission Certified

API 607-7th & ISO 10497
Firesafe Certified

Torque Arm

Used in larger sizes the torque arm prevents stem movement which reduces wear on packing rings and enables better sealing as well as reducing torque. Non rotating stem, only the stem nut rotates. The arm also provides visual stem position indication and can be interfaced with position switches. Optional live loaded packing system is shown.

API 600 CAST STEEL VALVES

APV Cast steel valves are designed and manufactured to conform with API, ASTM, ANSI and other applicable internationally recognised standards, to possess all the qualities to meet with stringent requirement criteria of petroleum, petro-chemical and general industrial applications.

APV Valves are tested in accordance with applicable API standards. Full traceability is maintained.

APV Valves offer the option of hard facing on the wedge (disc) and seating areas.

APV Gate Valves are optionally available with lantern rings. These rings along with double packing provide a leak-off connection. Alongside are illustrations of lantern rings as well as disc connection. Fugitive emission packing sets do normally need a lantern ring.

FUGITIVE EMISSION SERVICE

APV offers fugitive emission service valves on special request. The valves comply with environmental protection requirements. APV fugitive emission valves are designed, manufactured and tested to meet less than 100ppm with packing conforming to API 622 and valve design tested to API 624 and ISO 15848-1. Furthermore, optional live-loading of packing bolts is available. Two sets of belleville plate springs maintain a permanent packing stress of 24,000-28,000 kPa. Live-loading extends low emission service life especially in service with high pressure/temperature transients.

The stem on all APV fugitive emission service valves is surface finished to $\leq Ra\ 0.80\ \mu m$. Straightness and roundness are precisely controlled. The stuffing box has a maximum $\leq Ra\ 3.2\ \mu m$ surface finish. Cylindricity and verticality are precisely controlled.

GENERAL DESIGN SPECIFICATIONS

	STANDARD
Shell wall thickness and general valve design specifications	API 600 (Gate Valves) API 603 (Gate Valves) API 594 (Check Valves) API 623 (Globe Valves)
Pressure-temperature ratings	ANSI B16.34
Face-to-face & End to end dimensions	ANSI B16.10
Flanged end dimensions	ANSI B16.5*
Welding end dimensions	ANSI B16.25

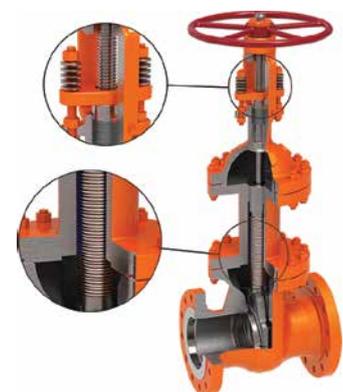

*Valves 700NB (28") and larger according to MSS SP-44 or API 605 are available.

LIVE LOADING

Live Loading is an addition of spring washers to the gland studs to maintain the packing load of the valve over time.

BELLOW SEAL

The bellow seal replaces the dynamic sealing system of a stem packing by a static sealing system between the valve bonnet and the valve stem bottom. It prevents the valve from the risk of leakage from the valve packing for VOC or toxic services.

Bellows Seal Option

BOLTED BONNET GATE VALVES

FEATURES

Full body wedge guides allow correct wedge alignment. Yoke sleeve with bearings reduce torque for easy operation. Seat rings allow easy access for maintenance and packing replacement is simple. Seat face 13Cr hardfaced, ground and lapped to a Ra 0.4~0.8 µm finish. Wedge is ground and lapped to a Ra 0.4~0.8 µm finish and tightly guided to prevent dragging and seat damage. Non-rotating stem with precision Acme threads and burnished finish. Rotating stem nut is austenitic ductile iron Gr. D-2C renewable.

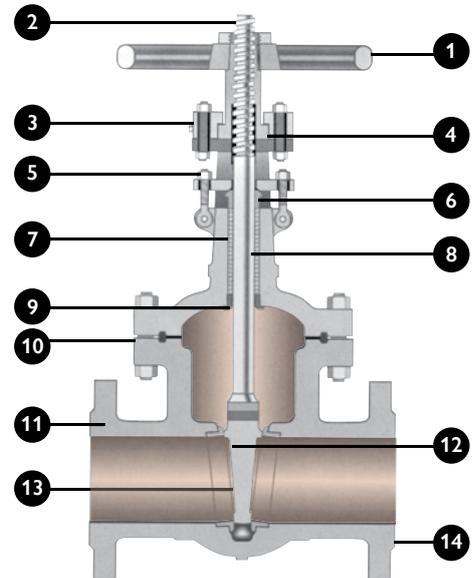

STANDARDS

API 600 and ANSI B16.34. Dimensions to ANSI B16.10 and ISO 5727. Stuffing box smoothness ≤Ra 3.2 µm superior to API 600. Stem smoothness ≤Ra 0.80 µm as per API 600.

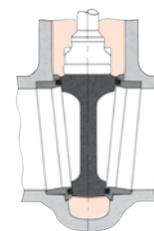

SOFT SEATED TRIM OPTION

All gate valves are available with optional PTFE seat rings. The moulded PTFE ring is bonded into a seat ring groove in the face for maximum service life. This design is excellent for lower temperature service where tight shutoff is required.

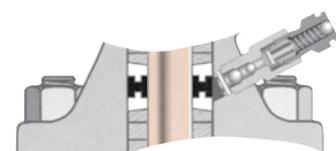

Parallel slide style also available, see page 20, 84 - 88 and also see APV Steamco Catalogue

1. Handwheel
2. Rising Stem - provides open-close indication
3. Grease Fitting - to minimise wear and operating torque
4. Yoke Sleeve - furnished in ductile Ni-resist or aluminium-bronze for low torque operation
5. Swing Bolt - easier maintenance and packing replacement
6. Gland - flange is self-aligning to eliminate stem damage
7. Stuffing Box
8. Stem - upset forge T-head stems to eliminate possibility of a bent stem jamming the valve
9. Backseat - provides back-up stem seal
10. Bonnet Joint
11. Body - full ported, heavy wall body API 600 wall thickness
12. Wedge - heavy pattern. Available in solid & flex wedge
13. Seat Ring - full ported rings for easy maintenance
14. End Connections - flanged or butt weld ends

Soft seated "ST" trim option

Sealant injector and lantern ring option

Fugitive Emission Certified

ISO 10497-1 & API 607-7th
Firesafe Certified

BOLTED BONNET GLOBE VALVES

OPERATION

Seat rings are easily accessible for repair or replacement. Australian Pipeline Valve globe valves are for services requiring frequent operation for on-off isolation service as well as throttling. Never attempt throttling at under 20% of stem travel. Closer throttling, can result in higher pressure drops which may cause excessive velocities or cavitation and could cause vibration or high noise levels resulting in damage to the valve or adjacent components/structure.

LIFE

Heavy construction provides years of reliable service.

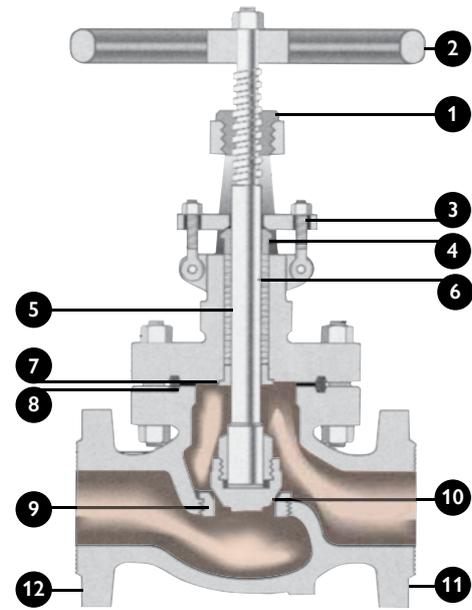

DESIGN

Available in bolted and pressure seal bonnet, outside screw and yoke, rising stem with ball or plug type disc, and have flanged or butt weld ends. Screw down non-return (Stop check) also available. Stem with precision Acme threads and burnished finish. Valve suitable for horizontal installation. Conical seating surfaces 13Cr hardfaced/stellite, ground and lapped to a Ra 0.4~0.8 µm finish. Tapered plug type disc as standard. Body guided disc on larger sizes, and higher classes on smaller sizes, accurately mates the hardfaced surface of the disc with the surface of the seat. Body and bonnet joint accurately machined. Fully enclosed gasket. Rotating stem nut, austenitic ductile iron Gr. D-2C, renewable in-line.

STANDARDS

To ASME B16.34 / API 623. Dimensions to ASME B16.10 and ISO 5752.

Wall thickness, stem smoothness and stuffing box finish complies with API 623. APV stuffing box smoothness $\leq Ra\ 3.2\ \mu m$ superior to API 623 / API 600. Stem smoothness $\leq Ra\ 0.80\ \mu m$ as per API 623.

1. Yoke Sleeve - furnished in aluminium-bronze to reduce torque. Larger sizes furnished with bearings
2. Handwheel
3. Swing Bolts - easier maintenance
4. Gland - self-aligning to eliminate stem damage
5. Stuffing Box
6. Stem - heavy duty
7. Backseat - provides back-up stem seal
8. Bonnet Joint - ring joint or spiral according to ANSI class
9. Seat Rings - separate heavy duty, full ported rings for easy maintenance
10. Disc - heavy duty disc plug design
11. End Connections - flanged or butt weld ends
12. Body - full ported, with API 600 / API 623 heavy wall thickness
13. Stem guide - (Optional) for reduced packing wear

BOLTED BONNET CHECK VALVES

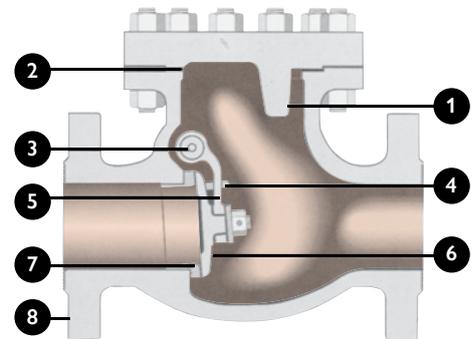

Australian Pipeline Valve valves are designed to provide fast valve action and maximum life. All valves are full ported, have full API 594/API 600 wall thickness, and meet the requirements of ANSI B16.34. Full opening API 6D (piggable) type also available on request.

DESIGN

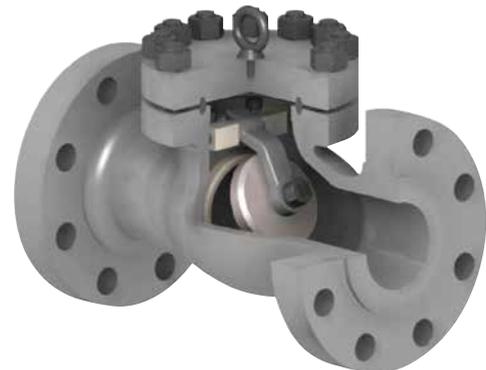

ASME B16.34 / API 594 /API 6D as applicable.

FEATURES

Check valves are designed to close quickly in either horizontal or vertical (flow up) pipe runs. The body seat ring is installed on a 3° angle. This allows our check valve to close even when installed in horizontal pipe run with no pressure.

1. Disc Stop - provides positive stop in open position
2. Bonnet Joint - (ring or spiral according to class)
3. Hinge Pin - solid pin for maximum strength
4. Securing Lugs - allow disc to seat freely and prevent disc spinning
5. Hinge - designed to withstand shock and load of quick closing
6. Disc - disc is bolted and pinned to hinge; ground seating surface is mated to seat ring for positive shut off
7. Seat Ring - Full port seal welded or screwed
8. End Connections - flanged or butt weld

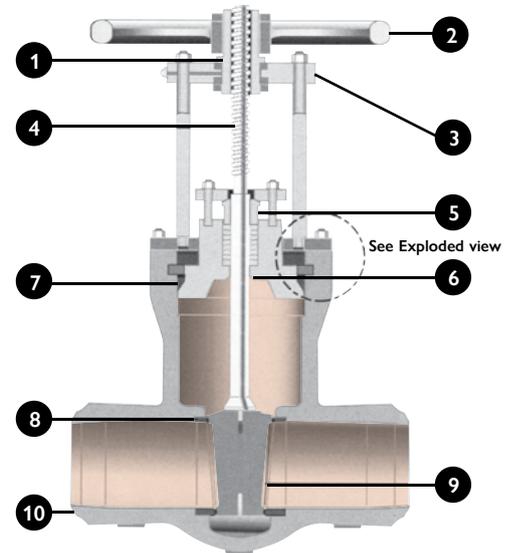

API 6FD & API 6FA-5th
Firesafe Certified
(API 6D Version)

PRESSURE SEAL BONNET VALVES

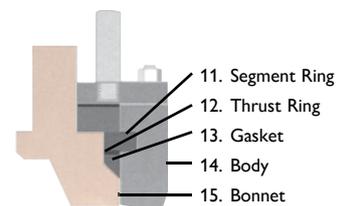

FLEXIBLE WEDGE GATE VALVE

The wedge is a one piece, fully guided wedge. Available in flex wedge and solid wedge. (Flexible wedge allows the seating faces to move to compensate for thermal expansion). Wedging actions allows a tight seal even in low differential pressure services. Flexible wedge construction resists wedge sticking in service where the valve may be closed when hot and opened when cold. Seating surfaces are hardfaced for long life.

Parallel slide also available, see page 20, 84 - 85 and also see APV Steamco Catalogue.

1. Yoke Sleeve - aluminium-bronze yoke sleeve has thrust bearings to minimise torque
2. Hand Wheel - (or gear in larger sizes)
3. Yoke - offering ease of maintenance
4. Stem - The design allows the wedge to self-align, eliminating the possibility of jamming the wedge
5. Gland - two piece, self-aligning gland eliminates cocking. Swing out bolting facilitates maintenance
6. Back Seat - Integral, hardfaced
7. Pressure Seal - retaining ring and mild steel silver plated/SS/SS+GRP gasket to aid disassembly and provide maximum seal
8. Seat Ring - hardfaced seat rings are welded to body. Tapered design provides clear flow path
9. Wedge - one-piece, fully guided. Parallel seat also available
10. Body - streamlined flow path minimises pressure drop. API 600 wall thickness

PRESSURE SEAL BONNET VALVES

PARALLEL SLIDE GATE VALVES

Normally utilised for shut off service but are not recommended for throttling. Gate valves are normally installed in horizontal pipe runs with the valve stem vertically up. They can be installed in horizontal or vertical pipe runs. After closing with sufficient force, the stem should be backed off slightly (1/8 turn) to relieve stem load. Parallel Slide Valves have self aligning discs with no wedging force and react freely to thermal changes. The design also ensures uniform seat wear and ease of maintenance. Parallel Slide Gate Valves are ideal where high differential pressure or thermal expansion may cause sticking of wedge to gate in traditional gate valves.

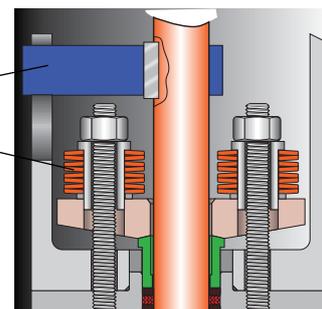

- 1. Yoke Sleeve - aluminium-bronze yoke sleeve with thrust bearings for ease of opening
- 2. Actuation - Low torque seating design reduces actuation costs
- 3. Yoke - designed to offer ease of maintenance
- 4. Stem - Threaded into disc housing and also pinned
- 5. Gland - two piece, self-aligning gland eliminates cocking. Swing out bolting facilitates maintenance
- 6. Back Seat - Integral, hardfaced
- 7. Pressure Seal - retaining ring and mild steel silver plated/SS/SS+GRP gasket to aid disassembly and provide maximum seal
- 8. Seat Ring - hardfaced seat rings are welded to body and are designed for ease of maintenance
- 9. Discs - Spring loaded discs are self-aligning and reduce actuator torque requirements
- 10. Integral Stop - Integral stop positions for reliable seating

Pressure Seal Bonnet Non Rotating Stem & Live Loaded Packing

The torque arm design guides and centralises the stem and prevents stem movement which reduces wear on packing rings & enables better sealing as well as reducing torque. Only the stem nut rotates. The arm also provides visual stem position indication & can be interfaced with position switches. Optional live loaded packing system is shown.

PRESSURE SEAL BONNET VALVES

GLOBE & SDNR CHECK VALVES

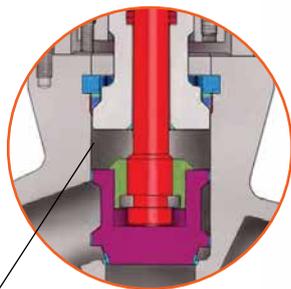

Australian Pipeline Valve Globe valves are installed with pressure and flow under the disc. Globe valves are suitable for most throttling applications; they should not be used for throttling at less than 10% open. Stop Check Valves have a guided loose disc allowing the valve to act as a combination globe valve and check valve.

API 622 & ISO 15848-1
Fugitive Emission Certified

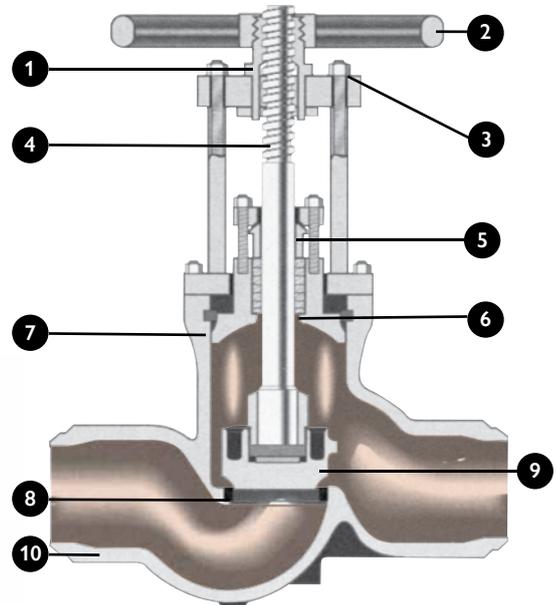

API 607-7th & ISO 10497
Firesafe Certified

Body Guided Disc

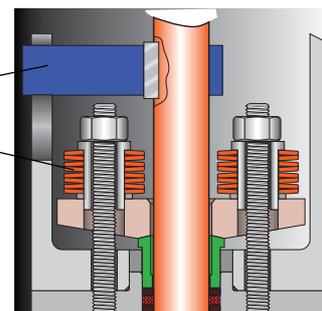

Body guided disc style eliminates side thrust and provides longer disc, seat and body life as well as ensuring positive shut-off and low closing torque.

1. Yoke Sleeve - aluminium-bronze yoke sleeve minimizes operating torque. Larger sizes have needle bearing type thrust bearings
2. Actuation - Manual handwheel gear operator or actuated
3. Yoke - designed to offer ease of maintenance
4. Stem - precision-ground stem has upset tee-head for reliable stem/wedge connection
5. Gland - two piece, self-aligning gland eliminates cocking. Swing out bolting facilitates maintenance
6. Back Seat - Integral, hardfaced
7. Pressure Seal - uncomplicated design has segmented retaining ring and mild steel silver plated/SS/SS+GRP gasket to aid disassembly and provide maximum bonnet seal
8. Hardened Seating Surfaces - both disc and body seating surfaces are hard faced for maximum service life
9. Disc - fully body guided for positive seating
10. Body - Full port 's' pattern design available to minimise pressure drop

Pressure Seal Bonnet Non Rotating Stem & Live Loaded Packing

The torque arm design guides and centralises the stem and prevents stem movement which reduces wear on packing rings & enables better sealing as well as reducing torque. Only the stem nut rotates. The arm also provides visual stem position indication & can be interfaced with position switches. Optional live loaded packing system is shown.

PRESSURE SEAL BONNET VALVES

CHECK VALVES

Australian Pipeline Valve Check valves are installed with pressure and flow under the disc.

TILTING DISC CHECK VALVES

Reduced maintenance is assured because the disc is the only moving part and is designed to minimise flutter in the closed position, thus reducing wear on the pivot pin, disc, and seat.

Loss of head is minimised by the balanced disc and its 'aerofoil' design.

Short distance of travel, combined with a balanced disc allows rapid closure while minimising slamming.

Drip tight seating is accomplished over the full pressure range because a slight clearance at the pivot pin assures complete seating between the disc ring and body ring.

The hinge pin located near the center of gravity allows the conical seating face of the disc to move out and into the seat rapidly without sliding or wear.

The disc pivots through a small arc preventing backflow and 'water hammer'.

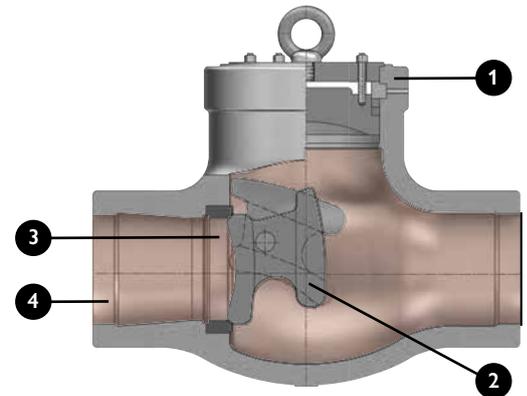

Superior tightness - conical, lapped-in hardfaced seating is self aligning.

Valve can be used in horizontal but also even in vertical piping with flow up.

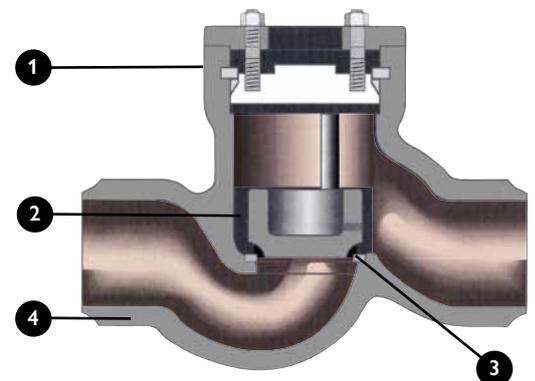

PISTON LIFT CHECK VALVES

Piston Lift Check valves are generally used in applications where pressure drop through the valve is not critical, although APV piston check valves have a relatively low pressure drop. available in horizontal, right angle, Y patterned (inclined) and vertical designs. Excellent for low or pulsating flows with good to moderate sealing capability. APV offers fully guided disc through the total travel.

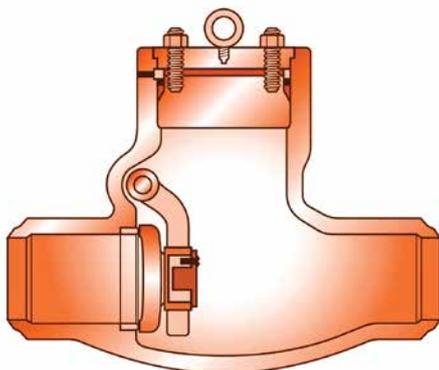

Piston Lift Check Valves may be equipped with equaliser lines to vent the bonnet area above the disk and eliminate any dash-pot effect during rapid operation. An aspirator is also available with an adjustable valve to control disc opening and closing speed.

- 1. Pressure seal design - with retaining ring
- 2. Tilting disc - internal pin
- 3. Welded in - hardfaced seat ring
- 4. Full port

- 1. Pressure seal design - with retaining ring
- 2. Guided disc - for positive seating
- 3. Welded in - hardfaced seat ring
- 4. Full port - S pattern flow path available to minimise pressure drop

CRYOGENIC VALVES

General Design & Wall Thickness

Cast Gate Valves - ASME B16.34
Cast Globe Valves - ASME B16.34

Inspection & Test BS 6364

Long Life Seating Surface

Stellite 6 faced both seat and wedge/disc to prevent seizing and galling.

End Flange Dimensions

ASME B16.5

Butt Weld End Dimensions

ASME B16.25

End to End Dimensions

Flanged - ASME B16.10
Butt Weld - ASME B16.10

Extended Bonnet Bolted or integral vapour space extended bonnet of sufficient length to keep stem packing out of the cold zone and free of ice formation.

Austenitic Stainless Steel Forgings or Castings

Tough at cryogenic temperatures and can be classed as a 'cryogenic steel' with good impact strength and corrosion resistance.

Shell and Trim Parts are all austenitic stainless steel and sub-zero treated in LN.

Insulation Collar / Drip Plate A 'welded' insulation collar/drip plate or a 'clamped on' insulation collar/drip plate can be provided on request.

API 6D THROUGH CONDUIT GATE VALVES INTRODUCTION - SLAB & GATE EXPANDING STYLE

Slab Gate

Expanding Gate

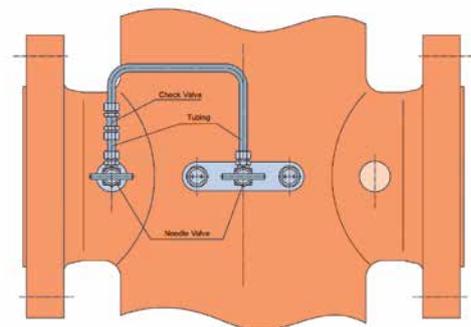

OVERVIEW API 6D THROUGH CONDUIT GATE VALVES

Through conduit Full bore

The through conduit opening design provides full flow passage and allows for the smooth passing of pipeline pigs. Pressure drop through the valve is no greater than that through an equal length of equal diameter pipe.

External pressure relief system for cavity over pressure protection

Due to the double tight sealing isolation design for expanding gate valve, cavity pressure can increase significantly through thermal expansion of fluid in the cavity. A body cavity thermal relief system can be provided to relieve this excess body cavity pressure.

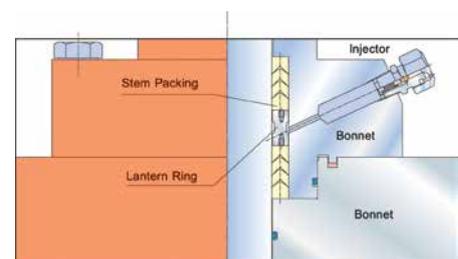

In Line repairable

The top entry design allows for access to all internal parts if maintenance is required with the valve still in the pipeline.

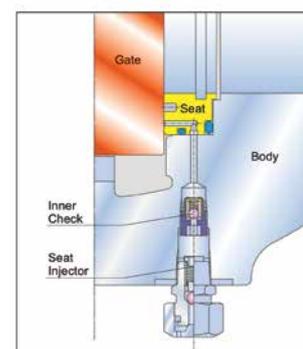

Ease of on-line stem packing maintenance

Top and bottom Chevron PTFE packing + lantern ring is the standard stem seal equipped with a stem injector with integrated check valve. Injectable packing material can be injected directly into the packing box through the injector to enhance stem sealing while the valve is under pressure.

Emergency sealant injection on seats

Provision of seat injectors with integrated check valve provides emergency backup sealing. Additionally, an inner check valve is installed in front of the seat injector to prevent blow out in case of wrong operation. If a seal surface is damaged by foreign matter, valve leakage can be eliminated by using a sealant injected into a specially designed groove in the seat ring assembly. This secondary seat sealant injection backup provides a peace of mind to users who demand reliable block valve service until the valve can be properly serviced. Seats may be lubricated by injecting lubricant to enhance service life and reduce operating torque.

CONSIDERATIONS OF TECHNICAL RISK / LIMIT OF LIABILITY FOR APV GATE, GLOBE, CHECK VALVES

Australian Pipeline Valve don't consider in our design the following factors of risk

1. Australian Pipeline Valve 'Standard' valves can be used in a temperature range between -29 to +490°C. (Note, pressure limitations apply above 38°C refer to Pressure/Temperature charts.) For service temperatures below -29°C valves construction materials shall be submitted to an impact test at the minimum service temperature. For temperatures above and below the standard range, special seals need to be specified by the client.
2. The onus is on the customer to specify all materials of construction and service conditions. Australian Pipeline Valve shall assume standard materials and conditions if not otherwise specified.
3. Australian Pipeline Valve 'Standard' valves are not equipped with devices suitable to avoid internal over-pressures caused by incorrect operations of process or by-fluids & liquids subjected to an increase of volume and/or pressure (these devices, such as the over-pressure hole in the gate or safety seats are available upon request).
4. Australian Pipeline Valve 'Standard' valves are not designed with special devices to withstand a sudden thermal jump (thermal shock).
5. In general Australian Pipeline Valve 'Standard' valves are not mechanically designed to bear overloads due to exceptional atmospheric or natural phenomenon's (such as earthquakes).
6. In general Australian Pipeline Valve 'Standard' valves are not designed to bear loads on flanges, on pipe connections or pipe-line.
7. In general Australian Pipeline Valve 'Standard' valves can't withstand ice inside their bodies (in this case the user has to consider the optional stem extension for insulating, avoiding the presence of residual product inside the valve).
8. Australian Pipeline Valve 'Standard' valves are not suitable for low temperature service below -29°C (-20°F) unless supplied (in a suitable body material) with cryogenic stem extension and other modifications, (available on request).
9. Australian Pipeline Valve 'Standard' valves are suitable for 'industrial' oxygen (not medical) service when supplied degreased and packed in polyethylene bags only.
10. The compatibility between the valves construction materials and medium is selected by the user. The user is ultimately responsible for verifying the compatibility between medium and materials.
11. Abrasive or dirty service applications need to be considered and stated at time of order.

VALVE START-UP

Before installing the valve onto the pipe-line it is mandatory, for the user, to verify the compatibility of the valve with service conditions (medium, temperature and pressure). With reference to standard valves held in stock, the reseller and end user will have to assure themselves of the compatibility between the valve and the conditions required by the customer. Australian Pipeline Valve gate valves must be only used for on-off (fully open/fully closed) service.

Before using the valve in a potential explosive atmosphere it's necessary for the customer to -

- To verify the correct type of valve and operator is specified.
- To verify the compatibility between the valve and the zone in which the valve should be installed
- To foresee the pipe-line ground condition on which the valve should be installed
- To check that the temperature if the valve surface is not higher than the flammable point of the atmosphere in which the valve is installed (in this case specify an insulating cover device for the valve and an extension for the operator)
- To avoid mechanical knocks during the installation that may cause sparks.

Australian Pipeline Valve cannot be held responsible for damage caused by use of the product for any reason, especially if it is improper use or modified.

AUSTRALIAN PIPELINE VALVE®

COMPLETE PRODUCT LINE

“Australian Pipeline Valve produces isolation, control and flow reversal protection products for severe and critical service media in utility, steam, pipelines, oil & gas and process industries. APV valves and pipeline products form the most competitive portfolio in the market.”

QUALITY ASSURANCE AND CERTIFICATION

We are continually improving all facets of quality assurance. Full metallurgical and test certificates are always supplied for all pressure retaining parts, we also provide it on all major trim components.

We have endeavoured to provide a broad outline of our range and capabilities. Because we are continually developing new products for our customers this catalogue will, to some extent be incomplete. This catalogue is a general overview only, individual drawings and data sheets can be furnished on request.

If you have any requirement in the field of valves, please contact us for a prompt response. Continuous development of Australian Pipeline Valve products may necessitate changes in the design or manufacturing processes. Australian Pipeline Valve reserves the right to effect any such changes without prior notice.
